Description

TNS Race Track is a fast film-forming marking product based on acrylic resin with selected fillers in aqueous dispersion. It has been specially formulated and is used for marking asphalt tracks on road racing circuits.

Thanks to the selected fillers used in its special formulation, TNS Race Track can be used as a final coating for outdoor surfaces that require high skid resistance, such as access and exit routes in sports facilities.

The special formulation of TNS Race Track makes it possible to meet all the approval and safety standards required by the FIA (Federation Internationale de l'Automobile) and the FIM (Fédération Internationale de Motocyclisme) for products used to mark the road surface of race tracks. In contrast to a simple coloring system, Mapecoat TNS Race Track technology enables the production of highly durable, non-slip surfaces that retain their roughness for years, even in wet conditions.

The mechanical properties of the marking paint combined with its high resistance to potentially harmful substances to the flooring (such as de-icing salts, oil and petrol etc.) also make TNS Race Track an excellent solution for coating large areas that need to be treated regularly to prevent ice formation and/or for routine cleaning purposes.
